### 1 General information

### 1.1 Important information about this manual

**NOTICE** The plant operator is responsible for ensuring compliance with the local laws and regulations (e.g. accident prevention regulations, etc.). Incorrect operation or operating the FRG3015-F RV outside the specifications invalidates all warranty claims.

This installation and operating manual

- is an integral part of the FRG3015-F RV
- contains instructions and information about safe and correct installation and commissioning of the FRG3015-F RV
- must be available to all users throughout the entire service life of the FRG3015-F RV
- is intended for trained personnel who are familiar with the applicable standards and regulations and, in particular, with the relevant safety concepts, operation and maintenance of the FRG3015-F RV
- is protected by copyright and may not be altered without the manufacturer's permission

### 1.2 Product conformity

A Declaration of Conformity according to Machinery Directive 2006/42/EC has been issued for the FRG3015-F RV product.

### 1.3 Product features

- All connections to the system have 1" male thread and flat sealing
- Very convenient controls, compact, space-saving design.

# 2 Safety

### 2.1 Presentation of safety information

A DANGER DANGER indicates an imminent danger that may cause serious physical injury or death if the appropriate safety precautions are not in place.

warning WARNING indicates a danger arising through incorrect behavior (e.g. misuse, disregarding notices, etc.) that may cause serious physical injury or death.

▲ CAUTION CAUTION indicates a potentially dangerous situation that may cause minor or slight injuries if the appropriate safety precautions are not in place.

**NOTICE** NOTE indicates a situation that may cause material damage if the corresponding precautions are not taken.

### 2.2 Important safety information

- Before using the FRG3015-F RV, read this operating manual through carefully.
- Connect the FRG3015-F RV only to a power source that corresponds to the mains voltage specified on the rating plate of the FRG3015-F RV.
- The power supply to the FRG3015-F RV must be disconnected prior to maintenance, cleaning and repair work.
- Maintenance, cleaning and repair work may be carried out by trained specialist personnel only.
- The FRG3015-F RV must not be used if it is damaged or is no longer operating correctly. In this case, contact your specialist dealer immediately.
- Observe the maintenance instructions and intervals.
- Protect the FRG3015-F RV from the weather.
- Never use the FRG3015-F RV outdoors.
- The unit may be used only in accordance with its intended use.

### 2.3 Intended use

The control station FRG3015-F RV is used for constant maintenance of the flow temperature in surface heating systems. The control station is intended for use in dry rooms in residential or commercial areas. It is usually installed in the heating room or in a distribution cabinet.

The FRG3015-F RV is not intended to be operated by people (including children) with limited physical, sensory or mental capacities, or by people with insufficient experience or previous knowledge.

### 2.4 Foreseeable misuse

The following is considered to be foreseeable misuse:

- Operating the FRG3015-F RV beyond its specifications.
- Improper use of the FRG3015-F RV.
- Modifications to the FRG3015-F RV that have not been agreed with the manufacturer.
- Use of replacement or wear parts that have not been approved by the manufacturer.
- Operating the FRG3015-F RV outdoors.

### 2.5 Responsibilities of the plant operator

The plant operator must ensure that:

- the FRG3015-F RV is used only for its intended purpose
- the FRG3015-F RV is installed, operated and maintained according to the specifications of the installation and operating manual
- the FRG3015-F RV is operated only in accordance with local regulations and occupational health and safety regulations
- all precautionary measures have been taken to avoid dangers originating from the FRG3015-F RV
- all precautions for first aid and firefighting have been taken
- only authorized and trained users have access to the FRG3015-F RV and operate it
- users have access to this installation and operating manual at all times

### 2.6 Personnel groups

Only qualified persons may install and operate the FRG3015-F RV and carry out maintenance work.

### **Operators**

Operators are deemed to be qualified if they have read these operating instructions and understood the potential hazards associated with improper behavior.

### Fitters/commissioning engineers

Fitters/commissioning engineers are in a position to carry out work on the FRG3015-F RV, taking into consideration the applicable standards, provisions, regulations and laws and their technical training and technical knowledge, and can detect and prevent potential hazards.

### 2.7 Information on the operating environment

Corrosion and chemical and physical reactions can damage the control station.

The system planner is responsible for evaluating these parameters and developing remedies.

# 3 Components overview

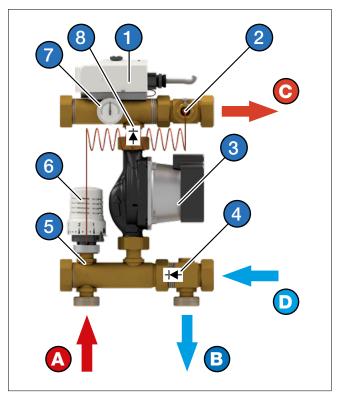

Fig. 3-1 Structure

- Temperature limiter (optional)
- Fitting with immersion sleeve, supply temperature sensor
- 3 Circulation pump
- 4 Insert check valve
- 5 Injection valve
- 6 Thermostatic head
- Supply temperature thermometer
- 8 Insert check valve
- A Primary supply (1" male thread)
- B Primary return (1" male thread)
- Surface heating supply/heating manifold (1" union nut)
- Surface heating return/heating manifold (1" union nut)

### 4 Mode of operation

The injection valve (5) is designed as a proportional controller and operates without auxiliary energy. The remote sensor (2) of the thermostatic head (6) situated in the supply (C) is in continuous contact with the flow temperature at all times. Deviations from the target value result in an immediate change in valve stroke and, accordingly, a change in the volume of the hot water injected from the boiler circuit (A).

The injected water volume is mixed with the return water from the manifold (D) at the inlet to the circulation pump (3) and, in this way, keeps the flow temperature constant within a narrow temperature range. The actual value can be checked on the thermometer (7).

Check valve (4) prevents a short-circuit of the primary circuit. The temperature limiter (1) switches off the circulating pump (3), when the supply temperature is exceeded, thus preventing the panel heating system from overheating.

### 5 Technical data

Hydraulic performance data					
Max. operating pressure	6 bar				
Max. ambient temperature <sup>1)</sup>	40 °C				
Max. operating temperature <sup>1)</sup>	80°C				
Setting range of supply temperature	20 - 70 °C				
Kvs value injection	2,50 m³/h				
Kvs value manifold side	3,50 m³/h				
Heating demand <sup>2)</sup>	14 kW at ∆T=10K				
Differential pressure	max. 500 mbar				
Media	Water/water-glycol mixture as per VDI 2035/ÖNORM (Austrian standard) 5195				
Connections to pipe networ	rk				
Primary (heat generator)	1" male thread, flat sealing				
Secondary (heat distribution)	1" fl. (union nut), flat sealing				
Toques of the fitting					
3/4"	35 Nm				
1"	55 Nm				
Materials					
Fittings	Brass CW617 N				
Pipes	Brass CW508L				
Seals and O-rings	AFM34/2 and EPDM				
Plastics	Impact resistant and temperature resistant				
Circulation pump and temperature limiter					
Technical data can be found in the enclosed technical documentation.					

- 1) Please refer also to technical leaflets of the pump.
- 2) To achieve the rated heat output the pressure difference primary circuit (boiler-/radiator circuit) to the secondary circuit (floor heating) should be at minimum 150 mbar (2.2 psi). The temperature difference between primary and secondary circuit should be at least 15 K.

# 6 Overall dimensions

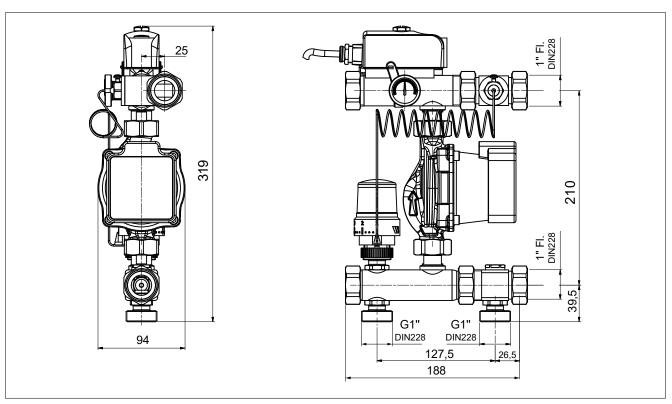

Fig. 6-1 Overall dimension

# 7 Pressure loss diagram

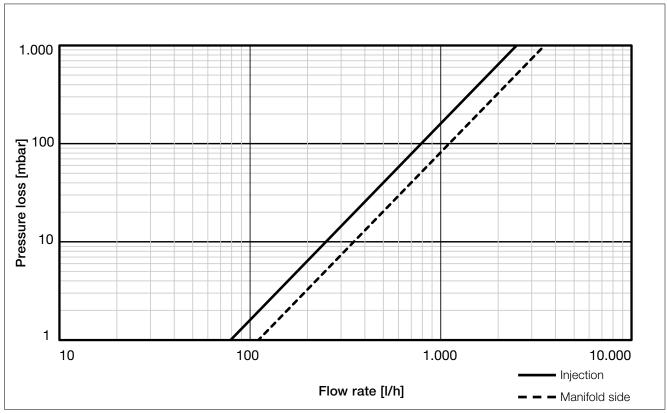

Fig. 7-1 Pressure loss diagram

# 8 Installation and commissioning

▲ DANGER Electrical energy! Risk of death from electric shock.

- Work on parts carrying live voltage must be carried out by qualified electricians only.
- Disconnect the power supply of the system and secure it to prevent it from being switched on again before carrying out any installation, maintenance, cleaning or repair work.

**NOTICE** The installation and commissioning of the FRG3015-F RV must be carried out only by trained personnel who have been authorized by the manufacturer.

A CAUTION When repairing the unit or replacing parts, be sure to observe the specified installation positions and flow directions of the parts being replaced!

A CAUTION Material damage!

Pressure shocks may occur if the stop valve is opened or closed quickly.

· Always open and close the stop valves slowly and in a controlled way.

### 8.1 Installation

All screw fittings must be checked and tightened if necessary prior to installation and commissioning! For the torques of the fitting see "5 Technical data" on page 4.

**A WARNING** Hot water!

Risk of severe scalding.

Do not reach into the hot water when emptying the FRG3015-F RV. Ensure that the FRG3015-F RV has cooled down before carrying out maintenance, cleaning and repair work.

During installation it must be ensured that:

- the cables from the pump and temperature limiter are not damaged or kinked
- the sensor capillary tube is not damaged or kinked
- The cables must not be under tension.
- 1. Fit the control station to the manifold with the 1" nuts and associated seals.

The control station can be fitted on the right or left of the manifold by turning the eccentric screw fitting (5, Fig. 8-1), also upside down.

- 2. Fit the temperature limiter to the supply collector pipe on the manifold.
- 3. Connect the control station to the power supply.

Further information about electrical connection of the control station can be found in the separate documentation for the assemblies.

4. Set the temperature on the (optional) temperature limiter to approx. 55 °C.

**NOTICE** To ensure that the pump runs only when heat is required, the manufacturer recommends connecting the pump to a pump relay (e.g. the pump logic of an electrical control distributor that also controls the actuators). Alternatively, the pump can be operated with a timer switch.

### 8.2 Temperature limiter

In the event of a fault, the temperature limiter switches off the circulation pump and so avoids overheating of the surface heating system.

- The temperature limiter must be fitted to the supply of the heating circuit manifold.
- Set the temperature on the (optional) temperature limiter to approx. 55 °C.

### 8.3 Initial commissioning

All screw fittings must be checked and tightened if necessary prior to installation and commissioning!

Torques of the fittings:

34" fittings: 35 Nm 1" fittings: 55 Nm

- 1. Connect the control station to the pipe network.
- 2. Fill, flush and vent the heating system.

The non-return valves (4 and 8, Fig. 3-1) in the mixer bypass prevents any short circuit when flushing.

**NOTICE** Flushing is permitted only in the direction of flow of the heating circuits, i.e. the water must enter through the flow manifold and come out of the return! The drain must always be open, as otherwise the high water pressure could damage the heating system. The instructions on flushing in the operating manual for the heating circuit manifold must also be observed.

### 8.4 Setting the floor flow temperature

The adjustment handwheel on the thermostat head has a scale of 1 - 7 (A, Fig. 8-1). The set temperature should be taken from the table:

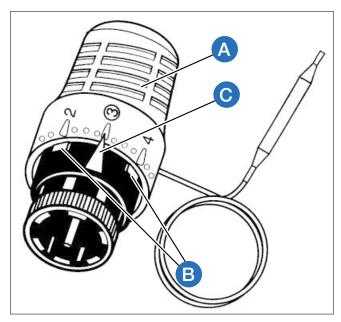

Fig. 8-1 Setting of the supply temperature

1	2	3	4	5	6	7
20 °C	28 °C	37 °C	45 °C	53 °C	62 °C	70 °C

### 8.5 Limiting the floor flow temperature

Flow temperatures above 50 °C are not usually used for surface heating systems.

The system temperature is often significantly lower than the maximum value that can be set on the thermostat head. To avoid damage to the floor structure from excess temperature, the flow temperature set value can be limited and locked in on the thermostat head.

- 1. Set the temperature and, with the surface heating running, check it on the thermometer.
- 2. If it is correct, position one of the locking devices (B) directly in front of and behind the marking arrow (C).

The setting can also be protected by an additional adjustment lock (accessory: SE 148 GA) to prevent unintended actuation.

# 9 Troubleshooting

	Fault				
	Possible cause	Remedy			
1	Underfloor heating circuits do not heat up; pump not running				
1.1	Temperature limiter (TL) is switching the control station pump off.	Set TL to approx. 10 K higher than the underfloor heating flow temperature.			
	Reason: TL setting is too low.	Note the maximum permitted temperature for the underfloor heating!			
		The switching difference of the TL is approx. 5 K.			
		The control station is ready to operate more quickly if the TL is removed briefly to cool down to its switching temperature.			
1.2	TL is switching the control station pump off.  Reason: The pump remains switched on despite closed	Remove TL from the control station and fit to supply heating circuit manifold.			
	underfloor heating circuits. The water inside the control station is being heated by waste heat from the pump. The TL switches the pump off when the maximum temperature is reached!	Use electrical control distributor with pump logic (relay). The pump logic ensures that the pump runs only if at least one underfloor heating circuit is open.			
1.3	The pump is connected to a room thermostat or electrical control distributor.	Remove TL from the control station and fit to supply heating circuit manifold.			
	If all actuators are closed, the pump switches off. During a lengthy shutdown, the underfloor heating flow cools down. The controller therefore causes the 3-way mixer valve to open. Hot water is injected from the primary heating circuit. As a result, the control station heats up. When the maximum temperature of the TL is reached, the contact opens. The pump does not switch on again.	See 1.1			
2	Underfloor heating flow temperature cannot be set to significantly	the required value or the feed temperature fluctuates			
2.1	Supply and return on the control station have been mixed up	Check that all connections on the control station are correct (see Section "Components overview" on page 4)			
2.2	The head / pumping level of the pump is set too low	Change the pump setting (see separate pump instruction manual).			
2.3	The differential pressure of the primary pump is too high (>500mbar)	Change the pump setting (see separate pump instruction manual) or fit differential pressure controller.			
2.4	The heating load is too high for the control station, i.e. heat consumption exceeds the nominal output of the control station. This condition can come about temporarily, for example, when heating up a "cold" floor.	Establish maximum heat requirement and compare with nominal output. The heating circuits may have to be shared with a second control station with a corresponding heating circuit distributor.			
		If this is caused by heating up the underfloor heating for the first time, it may start working normally after the heating up phase (2 – 3 days). This is particularly likely in the case of operation at the upper nominal output limit.			
2.5	The thermostat head is defective.	Replace the thermostat head.			

#### Maintenance 10

**▲ DANGER** Electrical energy!

Perform maintenance work on the FRG3015-F RV only when the power supply has been disconnected.

**A WARNING** Hot water!

Risk of severe scalding.

Do not reach into the hot water when emptying the FRG3015-F RV. Ensure that the FRG3015-F RV has cooled down before carrying out maintenance, cleaning and repair work.

A WARNING Hot surfaces!

Risk of serious burns.

Do not touch the pipes or components during operation. Ensure that the FRG3015-F RV has cooled down before carrying out maintenance, cleaning and repair work. Wear heat-resistant safety gloves if it is necessary to carry out work on hot components.

NOTICE

Maintenance of the FRG3015-F RV must

carried out only by trained personnel who have been authorized by the manufacturer.

### 10.1Annual maintenance

### 1. General visual inspection

· Check the control station for leaks and retighten sealing connections or replace seals, as required.

#### 2. Functional check

- Check that settings and operating and performance parameters are set correctly.
- · Check flow noise during operation.
- Ask users if there are any noticeable problems.

### 3. Action to be taken following maintenance work

- Check that all screw fittings that were unscrewed have been retightened and retighten if necessary.
- Remove all tools, materials and other equipment used from the working area.
- Restore the power supply.
- Slowly pressurize the FRG3015-F RV and vent it.
- · Readjust the system settings if required.

### 10.2Replacement of wear parts

Please note that the FRG3015-F RV contains parts that, for technical reasons, are subject to wear depending on the intensity of use, even if the specified care and maintenance has been provided.

This applies especially to mechanical parts and parts that come into contact with water and steam, such as seals, valves, etc.

By their nature, defects caused by wear do not constitute a fault and are therefore not covered by the warranty or any guarantee. Nevertheless, these defects and malfunctions must be remedied by trained specialist personnel only. Contact your specialist dealer for this.

# 11 Disposal

**A WARNING** Potential for contamination of the environment and groundwater from improper disposal!

The legal regulations and guidelines in the country of operation must be observed when disposing of components and operating materials.

- Ensure that all assemblies and components are de-energized.
- 2. Disassemble the FRG3015-F RV properly or commission a specialist company to do so.
- 3. Sort the assemblies and component parts into recyclable materials, hazardous substances and operating materials.
- 4. Dispose of the assemblies and components in accordance with local laws and regulations or take them to be recycled.

### 11.1 Return to the manufacturer

Get in contact with the manufacturer if you would like to return the FRG3015-F RV or parts of it.

# 11.2 Notification of administrative bodies and the manufacturer

Inform the manufacturer of decommissioning and disposal of the FRG3015-F RV for statistical purposes.

# 12 Warranty

WATTS products are tested extensively. WATTS therefore guarantees only to replace or repair components of the products supplied free of charge – at the sole discretion of WATTS – if, in the opinion of WATTS, they exhibit verifiable manufacturing faults. Warranty claims due to defects or defects of title may be asserted within one (1) year of delivery/transfer of risk. Excluded from the warranty is damage attributable to normal product use or friction and to damage resulting from modifications or unauthorized repairs to the products, for which WATTS rejects all claims for compensation (direct or indirect). (For more detailed information, please refer to our website.) In all cases, supply is subject to the General Terms and Conditions, which can be found on www.wattswater.eu/qtc/.

The descriptions and photographs contained in this product specification sheet are supplied by way of information only and are not binding.

Watts Industries reserves the right to carry out any technical and design improvements to its products without prior notice. Warranty: All sales and contracts for sale are expressly conditioned on the buyer's assent to Watts terms and conditions found on its website at www.wattswater.eu/gtc/. Watts hereby objects to any term, different from or additional to Watts terms, contained in any buyer communication in any form, unless agreed to in a writing signed by an officer of Watts.
